AMENDMENTS TO THE CLAIMS:

This listing of claims replaces all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (Currently Amended) A method of modeling a logic design, comprising: creating a graphical representation of the logic design;

receiving a selection that corresponds to a type of simulation code;

generating simulation code based on the graphical representation and the selection, the simulation code comprising executable code; and

using the simulation code to test the operation of the logic design, wherein using the simulation code comprises:

propagating a state through the simulation code; and

determining if there is an error in the logic design based on a propagated state,
wherein determining is performed via executable instructions that operate absent user
intervention.

- 2. (Original) The method of claim 1, wherein the graphical representation is comprised of functional block diagrams and virtual wires that interconnect the functional block diagrams.
 - 3. (Original) The method of claim 2, wherein creating comprises: retrieving the functional block diagrams from a database; and arranging the functional block diagrams and the virtual wires to model the logic design.
 - 4. (Original) The method of claim 2, wherein creating comprises: defining the functional block diagrams using simulation code; and arranging the functional block diagrams and the virtual wires to model the logic design.
 - 5. (Original) The method of claim 1, further comprising:

Serial No.: 10/054,179 No.: P12891

Filed: January 17, 2002

displaying a menu comprised of different types of functional block diagrams; receiving an input selecting one of the different types of functional block diagrams; retrieving a selected functional block diagram; and creating the graphical representation of the logic design using the selected functional block diagram.

6. (Canceled)

- 7. (Currently Amended) The method of claim [[6]] 1, wherein the state comprises one of a zero state, a one state, and an undefined state.
- 8. (Currently Amended) The method of claim [[6]] 1, further comprising: providing a visual indication if there is an error in the graphical representation of the logic design.
 - 9. (Currently Amended) A method of modeling a logic design, comprising: displaying a menu comprised of different types of functional block diagrams; receiving an input selecting one of the different types of functional block diagrams; receiving a selection that corresponds to a type of simulation code; retrieving a selected functional block diagram;

creating a graphical representation of a logic design using the selected functional block diagram, wherein creating comprises:

interconnecting the selected functional block diagram with one or more other functional block diagrams to generate a model of the logic design; and

defining the selected functional block diagram using the type of simulation code if
a function of the selected functional block diagram is undefined when retrieved;
generating simulation code to simulate operation of the logic design based on the
graphical representation and the selection, the simulation code comprising executable code; and
using the simulation code to test the operation of the logic design, wherein using the
simulation code comprises:

Serial No.: 10/054,179 No.: P12891

Filed : January 17, 2002

Page : 4 of 11

determining if there is an error in the logic design based on a propagated state, wherein determining is performed via executable instructions that operate absent user intervention;

wherein creating comprises:

interconnecting the selected functional block diagram with one or more other functional block diagrams to generate a model of the logic design; and

defining the selected functional block diagram using the type of simulation code if a function of the selected functional block diagram is undefined when retrieved.

10. (Canceled)

11. (Currently Amended) An article comprising a machine-readable medium that stores executable instructions for modeling a logic design, the instructions causing a machine to:

create a graphical representation of the logic design;

receive a selection that corresponds to a type of simulation code;

generate simulation code based on the graphical representation and the selection, the simulation code comprising executable code; and

use the simulation code to test the operation of the logic design, wherein using the simulation code comprises:

propagating a state through the simulation code; and

determining if there is an error in the logic design based on a propagated state, wherein determining is performed via executable instructions that operate absent user intervention.

- 12. (Original) The article of claim 11, wherein the graphical representation is comprised of functional block diagrams and virtual wires that interconnect the functional block diagrams.
 - 13. (Original) The article of claim 12, wherein creating comprises: retrieving the functional block diagrams from a database; and arranging the functional block diagrams and the virtual wires to model the logic design.

Serial No.: 10/054,179 No.: P12891

Filed : January 17, 2002

Page : 5 of 11

14. (Original) The article of claim 12, wherein creating comprises: defining the functional block diagrams using simulation code; and arranging the functional block diagrams and the virtual wires to model the logic design.

15. (Original) The article of claim 11, further comprising instructions that cause the machine to:

display a menu comprised of different types of functional block diagrams; receive an input selecting one of the different types of functional block diagrams; retrieve a selected functional block diagram; and create the graphical representation of the logic design using the selected functional block diagram.

16. (Canceled)

- 17. (Currently Amended) The article of claim [[16]] 11, wherein the state comprises one of a zero state, a one state, and an undefined state.
- 18. (Currently Amended) The article of claim [[16]] 11, further comprising instructions that cause the machine to:

provide a visual indication if there is an error in the graphical representation of the logic design.

19. (Currently Amended) An article comprising a machine-readable medium that stores executable instructions that cause a machine to:

display a menu comprised of different types of functional block diagrams; receive an input selecting one of the different types of functional block diagrams; receive a selection that corresponds to a type of simulation code; retrieve a selected functional block diagram;

No.: P12891

Serial No.: 10/054,179 Filed: January 17, 2002

create a graphical representation of a logic design using the selected functional block diagram, wherein creating comprises:

interconnecting the selected functional block diagram with one or more other functional block diagrams to generate a model of the logic design; and

defining the selected functional block diagram using the type of simulation code if a function of the selected functional block diagram is undefined when retrieved; generate simulation code to simulate operation of the logic design based on the graphical representation and the selection, the simulation code comprising executable code; and use the simulation code to test the operation of the logic design, wherein using the simulation code comprises:

determining if there is an error in the logic design based on a propagated state, wherein determining is performed via executable instructions that operate absent user intervention;

wherein creating comprises:

interconnecting the selected functional block diagram with one or more other functional block diagrams to generate a model of the logic design; and

defining the selected functional block diagram using the type of simulation code if a function of the selected functional block diagram is undefined when retrieved.

- 20. (Canceled)
- 21. (Currently Amended) An apparatus for modeling a logic design, comprising:
- [[a]] memory that stores executable instructions; and
- a processor that executes the instructions to:

create a graphical representation of the logic design;

receive a selection that corresponds to a type of simulation code;

generate simulation code based on the graphical representation and the selection, the simulation code comprising executable code; and

use the simulation code to test the operation of the logic design, wherein using the simulation code comprises:

propagating a state through the simulation code; and

determining if there is an error in the logic design based on a propagated

state, wherein determining is performed via executable instructions that operate

absent user intervention.

- 22. (Original) The apparatus of claim 21, wherein the graphical representation is comprised of functional block diagrams and virtual wires that interconnect the functional block diagrams.
 - 23. (Original) The apparatus of claim 22, wherein creating comprises: retrieving the functional block diagrams from a database; and arranging the functional block diagrams and the virtual wires to model the logic design.
 - 24. (Original) The apparatus of claim 22, wherein creating comprises: defining the functional block diagrams using simulation code; and arranging the functional block diagrams and the virtual wires to model the logic design.
- 25. (Original) The apparatus of claim 21, wherein the processor executes instructions to: display a menu comprised of different types of functional block diagrams; receive an input selecting one of the different types of functional block diagrams; retrieve a selected functional block diagram; and create the graphical representation of the logic design using the selected functional block diagram.

26. (Canceled)

27. (Currently Amended) The apparatus of claim [[26]] <u>21</u>, wherein the state comprises one of a zero state, a one state, and an undefined state.

Serial No.: 10/054,179 No.: P12891

Filed: January 17, 2002

Page : 8 of 11

28. (Currently Amended) The apparatus of claim [[26]] <u>21</u>, wherein the processor executes instructions to:

provide a visual indication if there is an error in the graphical representation of the logic design.

- 29. (Currently Amended) An apparatus comprising:
- [[a]] memory that stores executable instructions; and
- a processor that executes the instructions to:

display a menu comprised of different types of functional block diagrams; receive an input selecting one of the different types of functional block diagrams; receive a selection that corresponds to a type of simulation code; retrieve a selected functional block diagram; and create a graphical representation of a logic design using the selected functional

create a graphical representation of a logic design using the selected functional block diagram, wherein creating comprises:

interconnecting the selected functional block diagram with one or more
other functional block diagrams to generate a model of the logic design; and
defining the selected functional block diagram using the type of simulation
code if a function of the selected functional block diagram is undefined when
retrieved;

generate simulation code to simulate operation of the logic design based on the graphical representation and the selection, the simulation code comprising executable code; and

using the simulation code to test the operation of the logic design, wherein using comprises:

determining if there is an error in the logic design based on a propagated state, wherein determining is performed via executable instructions that operate absent user intervention;

wherein creating comprises:

interconnecting the selected functional block diagram with one or more other functional block diagrams to generate a model of the logic design; and

Serial No.: 10/054,179 No.: P12891 Filed : January 17, 2002
